When it comes to legacy program support in an overstressed supply chain, sourcing obsolete parts to fulfill program needs has become more challenging than ever. It requires persistence and at times creative ways to solve component sourcing issues. In this presentation we will review a small quantity of components that were needed to build spare CCA's for a legacy Military Program. We will review how a plan can be drafted & executed to ensure the sourced components are compliant and will meet the end user's intended environment.
