Having visibility into your supply chain is not optional. Visibility protects the supply chain and protecting the supply chain is a matter of National Security. It also is the key to being able to 1) better collaborate with suppliers, 2) make informed decisions, and 3) fix problems; problems like material shortages and single sourcing dependence. This discussion will cover how supply chain technology solutions are helping companies better understand the supply chain landscape and who the players are, down to the supplier, site, and part level.

In this discussion, Resilinc's CEO, Bindiya Vakil will discuss:

- The current state of the aerospace supply chain and shortages to be aware of: semiconductor shortage and how it has hit the aerospace industry the hardest, commodity price volatility occurring due to the China energy crisis, commodity shortages that we are tracking and how companies who have strong ties with Semiconductor factories have the upper hand sourcing chips
- Insights and best practices on managing supply chain risk: supplier collaboration, visibility, transparency, focusing on low-cost, high-impact commodities
- New supply chain technologies that are helping drive visibility and resiliency (AI, predictive analytics)
- The supply chain of the future: what it will take to build a more resilient supply chain over the next 30 years
